

ComicCraft – AI Comic Story Creator Using Gemini Models

1. Brainstorming & Ideation Phase

1. Project Concept

ComicCraft is a web application concept that turns a user's story idea into a personalized comic. It combines AI-based story generation with comic illustrations, an on-screen preview, and PDF export.

2. Problem Identification & Opportunity

Creating a comic manually requires story development, dialogue writing, and artwork preparation. ComicCraft explores how generative AI can assist with these creative tasks and make comic creation more accessible to non-artists and casual users.

3. Proposed Concept

The user enters a story prompt and selects preferences such as the main character, setting, tone, and art style. The application then develops a panel-by-panel outline, expands it into narration and dialogue, generates illustrations, and assembles the content into a comic preview.

4. User Creative Inputs

Creative Input	Purpose
Story Prompt	Provides the main idea or storyline for the comic.
Character Name	Defines the main character used in the story.
Setting	Specifies the story environment, such as a forest, school, or city.
Tone	Sets the mood, such as funny, dramatic, or adventurous.
Art Style	Selects the visual appearance, such as anime, pixel art, comic-book, or realistic.

5. Possible Applications

A sample use case is a brave fox exploring an enchanted forest with a dramatic tone and anime-style artwork. The user can also regenerate the comic with a funny tone or a comic-book style and export the reviewed result as a PDF.

6. AI Model Responsibilities

The proposed workflow divides the creative tasks between models. Gemini Flash can generate a structured comic outline, Gemini Pro can produce detailed narration and dialogue, and Stable Diffusion can create comic-style illustrations.

7. Final Expected Result

- Sequential comic panels
- Panel titles and scene descriptions
- Comic-style illustrations
- Captions and narration

- Character dialogue
- Downloadable PDF version

8. Outcome of the Ideation Phase

The ideation phase establishes the main ComicCraft workflow: user prompt → outline → story → illustrations → comic preview → PDF export. This provides the foundation for the application's requirements and design stages.
