

8. Project Demonstration Phase

ComicCraft – AI Comic Story Creator Using Gemini Models

Presenting the complete ComicCraft workflow to an audience

1. Demonstration Objective

The demonstration shows how a user can transform a simple idea into a personalized comic through the ComicCraft web interface and its AI-powered generation pipeline.

2. Preparation

Before starting the demo, install the required dependencies, configure the Gemini API key and Hugging Face token, and launch the FastAPI application using Uvicorn. Open the homepage and verify that the local application is accessible.

3. Introduction

Introduce ComicCraft as a web-based AI comic story creator that uses Gemini models for story content and Stable Diffusion for illustrations. Explain that the generated comic can be previewed and downloaded as a PDF.

4. Step 1 – Enter a Story Idea

On the homepage, enter a sample prompt such as “A brave fox exploring an enchanted forest.” Enter a character name and choose the setting, tone, and art style.

5. Step 2 – Generate the Comic

Submit the form and explain the generation flow: Gemini Flash produces a structured five-panel outline; Gemini Pro expands the outline into narration and dialogue; Stable Diffusion generates an illustration for each panel; and the backend combines the generated results.

6. Step 3 – Review the Preview

Display the comic preview page and go through the panels in sequence. Highlight the panel title, illustration, scene description, caption, and narration for each panel.

7. Step 4 – Download the PDF

Select “Download Your Comic as PDF.” Explain that the export workflow uses the layout builder and PDF exporter to arrange the panel images and story text into a multi-page PDF.

8. Step 5 – Show Export Confirmation

Display the export-success page along with its confirmation message. Highlight the “Go Create Another Comic” option, which takes the user back to the homepage.

9. Optional Technical Demonstration

For a developer-oriented presentation, open /docs and demonstrate the available API routes. The /generate-comic/json route can be used to show JSON-based generation, while /test-image can demonstrate image generation separately.

10. Closing Summary

Conclude by summarizing the complete workflow: user prompt, structured outline, narration and dialogue, panel illustrations, preview, and PDF export. The demonstration should use the actual running application and should not claim features or test results that have not been verified.
